

PROJECT OVERVIEW AISHA II

DETECTION OF CORROSIVE AND HYDRAULIC LIQUIDS BY GAUGES BASED ON THE COLLAPSE OF PERCOLATION CONDUCTIVITY - Basic concept and applications

Helge Pfeiffer¹, Peter Heer², Martine Wevers¹

DATE:
October 8, 2010

PLACE:
EASN Workshop - Paris

AIRCRAFT INTEGRATED STRUCTURAL HEALTH ASSESSMENT II (2008-2011)

1/5 Slat Tracks - Airbus A 320 – A380 - Fatigue crack monitoring

asco

2/5 Tailboom - EC 135 – Impact damage

3/5 Tailboom - Mil 8 – Fatigue cracks

4/5 Floorbeam/Seat tracks - corrosion prevention and detection

5/5 Doubler repairs - Fatigue cracks in critical rivet rows

Floor beam – corrosion prevention

PLAN B

Detection of corrosive liquids

Conductor versus isolator

Percolation conductivity

Electrically conductive glass fibre reinforced epoxy resin

Mat Res Innovat (1998) 2:164–169

PCS – Percolation conductivity sensor

PCS – Percolation conductivity sensor

PCS – Percolation conductivity sensor

- **Detect aqueous liquids**
 - > Use hygroscopic matrix, e.g. PVA
- **Use an inert, unharmed conductive compound**
 - > conductive ceramic powder
- **Design appropriate mixture**
 - > close to percolation threshold

PCS – Percolation conductivity sensor

PCS – Percolation conductivity sensor

PCS – Percolation conductivity sensor

PCS – Percolation conductivity sensor

PCS – Percolation conductivity sensor

PCS – Percolation conductivity sensor

- Extended sensor
- A limited number of sensors cover liquid-exposed positions at the cabin area
- Sensor has buffer capabilities – small amounts of liquids are absorbed
- No heavy certification issues to be expected

- Ingredients almost free of charge
- Reading out possible by a simple multimeter during light maintenance
- Ingredients unarmful

PCS – Percolation conductivity sensor

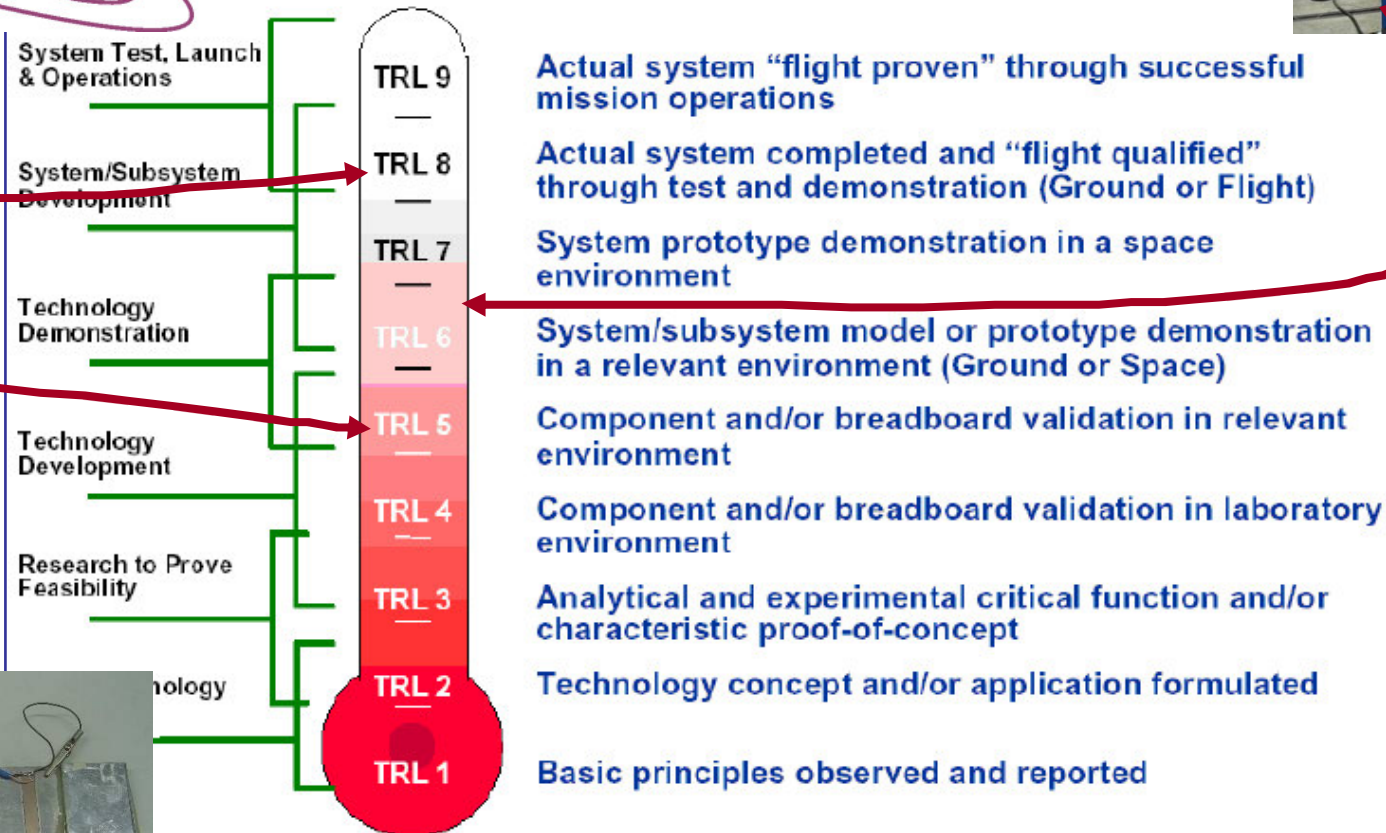

Next steps

- For AISHA II Implementation in airplane before end of 2010 (galley, lavatory, service door area)
- Data are collected during light maintenance and analysed by LHT/MTM
- “success” difficult to measure when no liquid ingress happens

TECHNOLOGY ASSESSMENTS TECHNOLOGY READINESS LEVELS

[illegible]

PCS – Percolation conductivity sensor

End of 2010, ready to take off for the AISHA II sensors?

PCS – Percolation conductivity sensor

-> Extension to different liquids

Pinhole cracks in hydraulic tubes – SKYDROL detection

When the cracks go through the complete tube:

- Initially, a fine hair crack exists, and the hydraulic fluid leaves the tube like in an aerosol spray – the aerosol condenses and/or it is spread by e.g. the airconditioning
- Later, plenty amounts of hydraulic liquid leave the crack

Pinhole cracks in hydraulic tubes – SKYDROL detection

Pinhole cracks in hydraulic tubes – SKYDROL detection

Conclusion

- Percolation threshold sensors developped for
 - aqueous liquids (galley area, lavatory, service door, ...)
 - phosphate ester based hydraulic liquids (SKYDROL etc)
- Extreme cheap materials
- Mainly rely on certified components
- Low certification threshold expected
- “Fuse” functionality (sensor keeps its state)
- Signal many orders of magnitude above baseline variations
- Reading out by a simple multimeter

Is this structural health monitoring??? ... you protect your structure by detecting harmful liquids passing through damaged sealings, pipes, ...

Acknowledgements

The research leading to these results has received funding from the European Community's Seventh Framework Programme [FP7/2007-2013] under grant agreement n°212912 (Project: Aircraft Integrated Structural Health Assessment II - AISHA II).

We want to thank Gregory Pyka for performing the SEM analysis and Johan Vanhulst for establishing the data logging facilities. Furthermore, a special thank to Kim Vanmeensel and Wout Veulemans for the support with the ceramic powder technology.

Thank you for your attention
